

T-TANG

RECOVERY

GENERAL DESCRIPTION

The T-Tang (also known as T-Catch in the fishing tools industry) is a fishing tool designed to engage and lock into a T-shaped groove machined onto the object to be retrieved downhole.

Unlike the Overshot, which envelops and grips the fish from the outside via a grapple, or the Spear, which inserts inside the fish, the T-Tang works through direct mechanical engagement: its T-shaped tang locates into the matching profile machined onto the piece to be fished. Its use therefore requires that the downhole component was designed with this T-profile in mind (a sub, mandrel, or specific downhole equipment).
