

TAPER TAP

RECOVERY

GENERAL DESCRIPTION

The Taper Tap is an internal catch fishing tool designed to retrieve tubular members from the well bore.

It is the most simple, rugged, dependable and economical internal catch fishing tool for freeing fish.

Skirt type Taper Tap is threaded for a skirt. A skirt is used when the hole size is drastically different from the fish size. The skirt is assembled to the Taper Tap and will assist in guiding the fish for proper engagement and retrieval.

USE

Assemble the Taper Tap to the bottom of the fishing string. Run in the hole until reaching the fish.
Apply minimum weight (less than one point) and rotate sufficiently to allow the wicker threads to be embedded into the interior surface of the fish. Once the fish has been securely engaged, it can be lifted from the hole.
